

Recent Advances in the Asymmetric NH(K) Catalytic in Chromium (Nozaki-Hiyama-Kishi)

Keith Korthals

First Example (sub-stoichiometric)

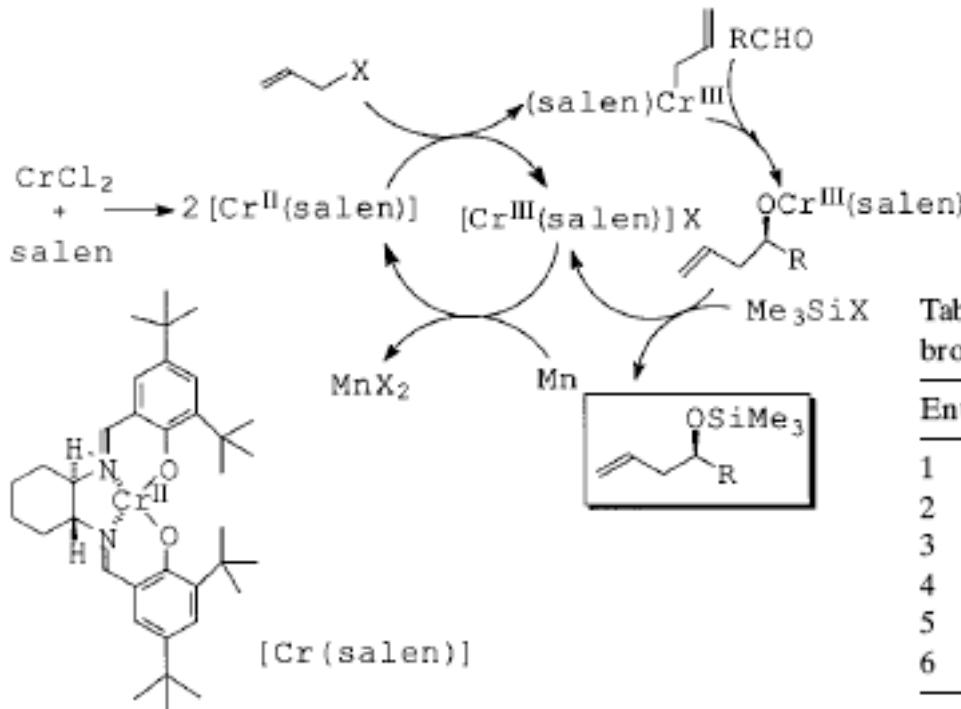

Table 1. Influence of bases on the enantioselective addition of allyl bromide to PhCHO catalyzed by [Cr(salen)] complex.

Entry	Base ^[a]	Yield [%] ^[b]	ee [%] ^[c]
1	—	56	21
2	K ₂ CO ₃	51	47
3	K ₂ CO ₃ ^[d]	52	25
4	Et ₃ N	65	65
5	Et ₃ N ^[e]	50	50
6	(tBu) ₂ Py	20	58

[a] All the bases were added to a suspension of salen and CrCl₂ in CH₃CN. All the reactions, except for that in entry 1, were carried out with 20 mol % of base. [b] Yield of isolated product after desilylation (HCl/THF) and flash chromatography. [c] The ee value was evaluated with a cyclodextrin Megadex 5.25 mt chiral column. The absolute configuration of the isolated homoallylic alcohol was assigned by comparison of the GC analysis trace with that of the known product.^[5a] [d] The reaction was carried out at 40°C. [e] 10 equivalents of Et₃N were employed.

First Example

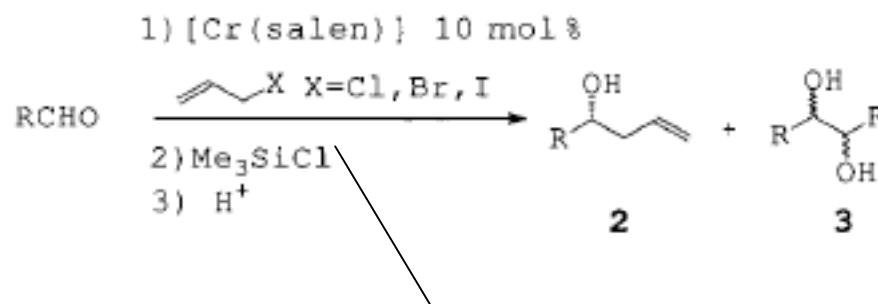

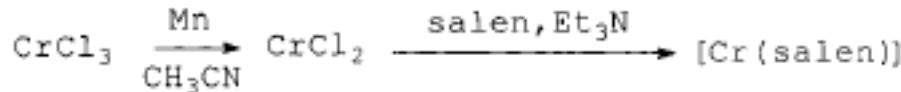

Table 2. Enantioselective addition of various allyl halides to PhCHO catalyzed by $[\text{Cr}(\text{salen})]$ complex.

Entry	RX	Yield [%] ^[a]	ee [%] ^[b]
1	$\text{CH}_2=\text{CH}-\text{CH}_2\text{Cl}$	67	84 (<i>R</i>)
2	$\text{CH}_2=\text{CH}-\text{CH}_2\text{Br}$	65	65 (<i>R</i>)
3	$\text{CH}_2=\text{CH}-\text{CH}_2\text{I}$	70	0
4	$\text{CH}_2=\text{C}(\text{CH}_3)-\text{CH}_2\text{Cl}$	62	42 (<i>R</i>) ^[c]
5	$\text{CH}_2=\text{C}(\text{CH}_3)-\text{CH}_2\text{Br}$	60	43 (<i>R</i>) ^[c]
6	$\text{CH}_2=\text{C}(\text{CH}_3)-\text{CH}_2\text{I}$	85	70 (nd) ^[d]

[a] Yield of isolated product after desilylation (HCl/THF) and flash chromatography. [b] Determined with a cyclodextrin Megadex 5.25 mt chiral column. The absolute configuration of the isolated homoallylic alcohol was assigned by comparison of the GC analysis trace with that of the known product.^[5a] [c] Determined with a cyclodextrin Megadex 5.25 mt chiral column on the corresponding O-methyl ether. The absolute configuration was assigned by comparing the optical rotation with that of the known product: $[\alpha]_D = +6.3$ ($c = 0.51$ in C_6H_6); literature value: *R* isomer, $[\alpha]_D = +50.2$ ($c = 1.16$ in C_6H_6).^[11a]

First Example

Table 3. Enantioselective addition of allyl chloride to aldehydes catalyzed by [Cr(salen)] complex.

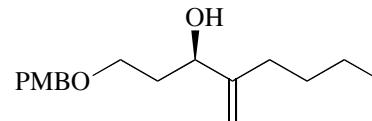

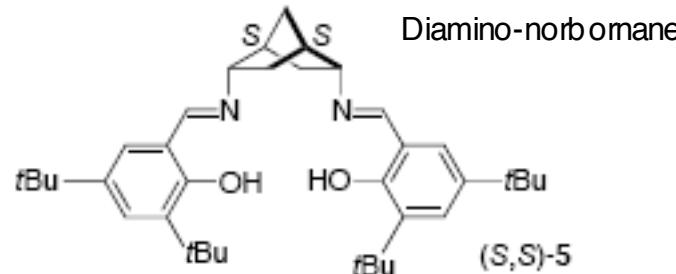

Entry	R'CHO	Yield of 2 [%] ^[a]	Yield of 3 [%] ^[b]	ee of 2 [%] ^[d]
1		NHK	Pinacol coupling	
1		67	16	78 (R) ^[e]
2		54	35	82 (R) ^[e]
3		41	40	77 (R) ^[e]
4		46	40	78 (R) ^[e]
5		42 ^[e]	0 ^[b]	89 (R) ^[f]
6		45 ^[e]	13	77 (S) ^[g]
7		40	40	65 (R) ^[e]

[a] Yield of isolated product after desilylation (HCl/THF) and flash chromatography. [b] The products 3 were obtained in racemic form. [c] Refers to the product obtained after desilylation ($\text{Bu}_4\text{NF}/\text{THF}$) and flash chromatography. [d] Determined with a cyclodextrin Megadex 5.25 mt chiral column. [e] The absolute configuration of the isolated homoallylic alcohol was assigned by analogy to the results obtained with PhCHO. [f] The absolute configuration of 1-cyclohexyl-3-buten-1-ol was determined by comparison of the chiral GC analysis trace with that of the known product.^[54] [g] The absolute configuration was assigned by comparison of the optical rotation with that of the known product $[\alpha]_D = -14.8$ ($c = 0.68$ in CHCl_3); literature value: *R* isomer, $[\alpha]_D = +12.2$ ($c = 1.00$ in CHCl_3).^[11b] The ee value was determined by HPLC analysis, column: Chiracel OD, eluent: hexane/isopropyl alcohol (95:5), flow rate: 0.5 mL min^{-1} , retention time: 16.6 min (*R*) and 25.0 min (*S*). [h] In this case 40% yield of (hydroxymethyl)cyclohexane was detected by GC analysis.

Side reaction of the pinacol problematic.

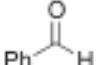

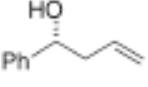

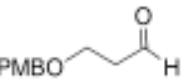

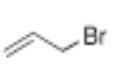

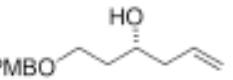

Another Ligand of the Same Type

61 % ee, 54 % yield 20 °C^(a)

From triflate with NiCl_2
 Furstner, N.

Table 1: Catalytic, enantioselective Nozaki–Hiyama–Kishi-type additions in the presence of ligand (S,S) -5.

Entry	Aldehyde	Halide	CrCl_3 , (0.1 equiv), (S,S) -5, (0.1 equiv), NEt_3 (0.2 equiv) ^[a]		ee [%] ^[b]	Yield [%] ^[b]	Reaction temperature ^[c]
			R^1CHO + R^2X (1 equiv) (1.5 equiv)	Mn (3 equiv), Me_3SiCl (1.5 equiv) THF			
1					90 ^[d,e]	72	5 °C
6					92 ^[e,h]	69 ^[i]	10 °C

[a] For entries 7 and 8, the reaction was run in the presence of 0.02 equiv of NiCl_2 . [b] Yield after flash chromatography. [c] Reaction temperature was optimized for entries 1, 2, 5, 6, 7, and 8. [d] Enantiomeric excess was determined by gas chromatography (GC) of the corresponding TMS ethers on a chiral stationary phase (Macherey–Nagel: Lipodex A, 95 °C). [e] Absolute configurations were assigned by comparison of optical rotations with literature data.^[5d,11,12] [f] Absolute configuration based on GC/HPLC data (that is, comparison of the products of entries 2 and 1 and of the products of entries 3 and 5 on an analytical scale). [g] Not determined. [h] Enantiomeric excess determined by HPLC on a chiral phase (Daicel: Chiralcel OD-H). [i] Some debenzylation occurred as a side reaction. [j] Absolute configuration determined by 1) oxidative cleavage (ozonolysis), 2) reduction to 1,2,4-butanetriol, 3) GC co-injection with a sample of known absolute configuration.^[13] [k] Reaction was performed with (R,R) -5. [l] Assignment of absolute configuration in analogy to entry 7.

2,6-lutidine was added to improve ee. Its role is not clear.
 Also tried 2,6-di-*tert*-butylpyridine, quinoline, and acridine.
 Only 2,6-lutidine worked.
