## chapter 3 stoichiometry:

## Calculations with Chemical Formulas and Equations

## Anatomy of a Chemical Equation

$$
\mathrm{CH}_{4(\mathrm{~g})}+2 \mathrm{O}_{2(\mathrm{~g})} \longrightarrow \mathrm{CO}_{2(\mathrm{~g})}+2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})}
$$

$+$

$\left(\begin{array}{ll}1 & C \\ 4 & H\end{array}\right)$
(4 O)
$\left(\begin{array}{ll}1 & C \\ 2 & \mathrm{O}\end{array}\right)$
$\left(\begin{array}{ll}2 & \mathrm{O} \\ 4 & \mathrm{H}\end{array}\right)$

## Anatomy of a Chemical Equation

$$
\mathrm{CH}_{4(\mathrm{~g})}+2 \mathrm{O}_{2(\mathrm{~g})} \longrightarrow \mathrm{CO}_{2(\mathrm{~g})}+2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})}
$$

Reactants appear on the left side of the equation.

## Anatomy of a Chemical Equation

$$
\mathrm{CH}_{4(\mathrm{~g})}+2 \mathrm{O}_{2(\mathrm{~g})} \longrightarrow \mathrm{CO}_{2(\mathrm{~g})}+2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})}
$$

Products appear on the right side of the equation.

## Anatomy of a Chemical Equation

$\mathrm{CH}_{4(\mathrm{~g})}+2 \mathrm{O}_{2(\mathrm{~g})} \longrightarrow \mathrm{CO}_{2(\mathrm{~g})}+2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})}$

The states of the reactants and products are written in parentheses to the right of each compound.

## Anatomy of a Chemical Equation

$\mathrm{CH}_{4(\mathrm{~g})}+2 \mathrm{O}_{2(\mathrm{~g})} \longrightarrow \mathrm{CO}_{2(\mathrm{~g})}+2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})}$

$\binom{1 \mathrm{C}}{4 \mathrm{H}}$
(4 O)
$\left(\begin{array}{ll}1 & C \\ 2 & \mathrm{O}\end{array}\right)$
$\left(\begin{array}{ll}2 & \mathrm{O} \\ 4 & \mathrm{H}\end{array}\right)$
Coefficients are inserted to balance the equation.
Balance: making the reaction agree with the conservation of mass.

# Subscripts and Coefficients Give Different Information 

- Subscripts tell the number of atoms of each element in a molecule

## Subscripts and Coefficients Give Different Information

- Subscripts tell the number of atoms of each element in a molecule or compound
- Coefficients tell the number of molecules or entities. (compounds).

Examples of Reactions

## Combination Reactions

- Examples:
$\mathrm{N}_{2(\mathrm{~g})}+3 \mathrm{H}_{2(\mathrm{~g})} \longrightarrow 2 \mathrm{NH}_{3(\mathrm{~g})}$
$\mathrm{C}_{3} \mathrm{H}_{6(\mathrm{~g})}+\mathrm{Br}_{2(1)} \longrightarrow \mathrm{C}_{3} \mathrm{H}_{6} \mathrm{Br}_{2(1)}$
$2 \mathrm{Mg}_{(\mathrm{s})}+\mathrm{O}_{2(\mathrm{~g})} \longrightarrow 2 \mathrm{MgO}_{(\mathrm{s})}$

## Decomposition Reactions

One reactant decomposes to more than one or more products

- One substance breaks down into two or more substances
- Examples:
$\mathrm{CaCO}_{3(\mathrm{~s})} \longrightarrow \mathrm{CaO}_{(\mathrm{s})}+\mathrm{CO}_{2(\mathrm{~g})}$
$2 \mathrm{KClO}_{3(\mathrm{~s})} \longrightarrow 2 \mathrm{KCl}_{(\mathrm{s})}+\mathrm{O}_{2(\mathrm{~g})}$
$2 \mathrm{NaN}_{3(s)} \longrightarrow 2 \mathrm{Na}_{(\mathrm{s})}+3 \mathrm{~N}_{2(\mathrm{~g})}$

## combustion Reactions

- Rapid reactions that have oxygen as a reactant
- sometimes produces a flame
- Most often involve hydrocarbons reacting with oxygen in the air to produce $\mathrm{CO}_{2}$ and $\mathrm{H}_{2} \mathrm{O}$.
- For our purposes combustion will mean:
- Oxygen reacting with something to form $\mathrm{CO}_{2}$ and $\mathrm{H}_{2} \mathrm{O}$
- Examples:
$\mathrm{CH}_{4(\mathrm{~g})}+2 \mathrm{O}_{2(\mathrm{~g})} \longrightarrow \mathrm{CO}_{2(\mathrm{~g})}+2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})}$
$\mathrm{C}_{3} \mathrm{H}_{8(\mathrm{~g})}+5 \mathrm{O}_{2(\mathrm{~g})} \longrightarrow 3 \mathrm{CO}_{2(\mathrm{~g})}+4 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})}$

Formula
weights

## The amuu unit

- Defined (since 1961) as:
- $1 / 12$ mass of the ${ }^{12} \mathrm{C}$ isotope.
- ${ }^{12} \mathrm{C}=12 \mathrm{amu}$

## Formula Weight (FW)

- Sum of the atomic weights for the atoms in a chemical formula
- So, the formula weight of calcium chloride, $\mathrm{CaCl}_{2}$, would be

Ca: 1 (40.1 amu)

+ CI: $2(35.5 \mathrm{amu})$
111.1 amu
- These are generally reported for ionic compounds

## Molecular Weight (MW)

- Sum of the atomic weights of the atoms in a molecule
- For the molecule ethane, $\mathrm{C}_{2} \mathrm{H}_{6}$, the molecular weight would be

$$
\begin{array}{r}
\text { C: } 2(12.0 \mathrm{amu}) \\
+\mathrm{H}: \quad 6(1.0 \mathrm{amu}) \\
\hline 30.0 \mathrm{amu}
\end{array}
$$

## Percent Composition

## The percent composition by element:

## (\# of atoms of element)(atomic weight) <br> $\%$ element $=\frac{(F W \text { or MW of the compound })}{} \times 100$

## Percent Composition

So the percentage of carbon and hydrogen in ethane $\left(\mathrm{C}_{2} \mathrm{H}_{6}\right.$, molecular mass $=30.0$ ) is:

$$
\% \mathrm{C}=\frac{(2)(12.0 \mathrm{amu})}{(30.0 \mathrm{amu})}=\frac{24.0 \mathrm{amu}}{30.0 \mathrm{amu}} \times 100=80.0 \%
$$

$$
\% \mathrm{H}=\frac{(6)(1.01 \mathrm{amu})}{(30.0 \mathrm{amu})}=\frac{6.06 \mathrm{amu}}{30.0 \mathrm{amu}} \times 100=20.0 \%
$$

Moles

## Making a Chemical Equation

$$
\mathrm{CH}_{4(\mathrm{~g})}+2 \mathrm{O}_{2(\mathrm{~g})}-\mathrm{CO}_{2(\mathrm{~g})}+2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})}
$$

How do I know how much methane and oxygen I need? My scale says grams, not number of atoms or molecules.x

## Atomic mass unit and the mole

- amu definition: ${ }^{12} \mathrm{C}=12 \mathrm{amu}$.
- The atomic mass unit is defined this way.
- $1 \mathrm{amu}=1.6605 \times 10^{-24} \mathrm{~g}$
- How many ${ }^{12} \mathrm{C}$ atoms weigh 12 g ?
- $6.02221409 \times 10^{23}{ }^{12} \mathrm{C}$ weigh 12 g .
- Avogadro's number
- The mole

## Atomic mass unit and the mole

- amu definition: ${ }^{12} \mathrm{C}=12 \mathrm{amu}$.
- $1 \mathrm{amu}=1.6605 \times 10^{-24} \mathrm{~g}$
- How many ${ }^{12} \mathrm{C}$ atoms weigh 12 g ?
- $6.0221409 \times 10^{23}{ }^{12} \mathrm{C}$ weigh 12 g .
- Avogadro’ s number
- The mole
- \#atoms $=\left(1^{12} \mathrm{C}\right.$ atom/12 amu $)\left(1 \mathrm{amu} / 1.66 \times 10^{-24}\right.$ $\mathrm{g})(12 \mathrm{~g})=6.02 \times 10^{23}{ }^{12} \mathrm{C}$ atoms weigh 12 g

## Therefore:

- $6.02 \times 10^{23}$
- 1 mole of ${ }^{12} \mathrm{C}$ has a mass of 12 g
- 1 mole of $\mathrm{H}_{2} \mathrm{O}$ has a mass of 18.0 g !

## The mole

- The mole is just a number of things
- 1 dozen $=12$ things
- 1 pair $=2$ things
- 1 mole $=6.022141 \times 10^{23}$ things
- $6.022141 \times 10^{23}$ atoms/mole
- SO
- 1 mole C atoms $=6.022 \times 10^{23} \mathrm{C}$ atoms

# Molar Mass The trick: 

- By definition, this is the mass of 1 mol of a substance (i.e., g/mol)
- The molar mass of an element is the mass number for the element that we find on the periodic table
- The formula weight (in amu's) will be the same number as the molar mass (in $\mathrm{g} / \mathrm{mol}$ )

## Using Moles

Moles provide a bridge from the molecular scale to the real-world scale
The number of moles correspond to the number of molecules. 1 mole of any substance has the same number of molecules.

## Mole Relationships

| Name of substance | Formula | Formula <br> Weight (amu) | Molar Mass (g/mol) | Number and Kind of Particles in One Mole |
| :---: | :---: | :---: | :---: | :---: |
| Atomic nitrogen | N | 14.0 | 14.0 | $6.022 \times 10^{23} \mathrm{~N}$ atoms |
| Molecular nitrogen | $\mathrm{N}_{2}$ | 28.0 | 28.0 | $\left\{\begin{array}{c} 6.022 \times 10^{23} \mathrm{~N}_{2} \text { molecules } \\ 2\left(6.022 \times 10^{23}\right) \mathrm{N} \text { atoms } \end{array}\right.$ |
| Silver | Ag | 107.9 | 107.9 | $6.022 \times 10^{23} \mathrm{Ag}$ atoms |
| Silver ions | $\mathrm{Ag}^{+}$ | $107.9^{\text {a }}$ | 107.9 | $6.022 \times 10^{23} \mathrm{Ag}^{+}$ions |
| Barium chloride | $\mathrm{BaCl}_{2}$ | 208.2 | 208.2 | $\left\{\begin{aligned} & 6.022 \times 10^{23} \mathrm{BaCl}_{2} \text { units } \\ & 6.022 \times 10^{23} \mathrm{Ba}^{2+} \text { ions } \\ & 2\left(6.022 \times 10^{23}\right) \mathrm{Cl}^{-} \text {ions } \end{aligned}\right.$ |

${ }^{a}$ Recall that the electron has negligible mass; thus, ions and atoms have essentially the same mass.

- One mole of atoms, ions, or molecules contains Avogadro's number of those particles
- One mole of molecules or formula units contains Avogadro's number times the number of atoms or ions of each element in the compound

$$
\begin{aligned}
& \text { Finding } \\
& \text { Empirical } \\
& \text { Formulas }
\end{aligned}
$$

# Combustion Analysis gives \% composition 

- Compounds containing $\mathrm{C}, \mathrm{H}$ and O are routinely analyzed through combustion in a chamber like this
$-\% \mathrm{C}$ is determined from the mass of $\mathrm{CO}_{2}$ produced
$-\% \mathrm{H}$ is determined from the mass of $\mathrm{H}_{2} \mathrm{O}$ produced
- \%O is determined by difference after the C and H have been determined

## Calculating Empirical Formulas

Find:

## One can calculate the empirical formula from the percent composition

## Calculating Empirical Formulas

The compound para-aminobenzoic acid (you may have seen it listed as PABA on your bottle of sunscreen) is composed of carbon (61.31\%), hydrogen (5.14\%), nitrogen (10.21\%), and oxygen (23.33\%). Find the empirical formula of PABA.

## Calculating Empirical Formulas

1. Assuming 100.00 g of para-aminobenzoic acid, find out how many moles of each element are in that 100 g .:

C: $\quad 61.31 \mathrm{~g} \times \frac{1 \mathrm{~mol}}{12.01 \mathrm{~g}}=5.105 \mathrm{~mol} \mathrm{C}$
H: $\quad 5.14 \mathrm{~g} \times \frac{1 \mathrm{~mol}}{1.01 \mathrm{~g}}=5.09 \mathrm{~mol} \mathrm{H}$
$\mathrm{N}: \quad 10.21 \mathrm{~g} \times \frac{1 \mathrm{~mol}}{14.01 \mathrm{~g}}=0.7288 \mathrm{~mol} \mathrm{~N}$
O: $\quad 23.33 \mathrm{~g} \times \frac{1 \mathrm{~mol}}{16.00 \mathrm{~g}}=1.456 \mathrm{~mol} \mathrm{O}$

## Calculating Empirical Formulas

2. Calculate the mole ratio by dividing moles of each element by the number of moles of the element with the least number of moles:

$$
\begin{aligned}
& \mathrm{C}: \frac{5.105 \mathrm{~mol}}{0.7288 \mathrm{~mol}}=7.005 \approx 7 \\
& \mathrm{H}: \frac{5.09 \mathrm{~mol}}{0.7288 \mathrm{~mol}}=6.984 \approx 7 \\
& \mathrm{~N}: \frac{0.7288 \mathrm{~mol}}{0.7288 \mathrm{~mol}}=1.000 \\
& \mathrm{O}: \frac{1.458 \mathrm{~mol}}{0.7288 \mathrm{~mol}}=2.001 \approx 2
\end{aligned}
$$

## Calculating Empirical Formulas

These are the subscripts for the empirical formula:

$$
\mathrm{C}_{7} \mathrm{H}_{7} \mathrm{NO}_{2}
$$

## Elemental Analyses

Compounds
containing other
elements are analyzed using methods analogous to those used for C, H and O

## Stoichiometric Calculations

| Equation: | $2 \mathrm{H}_{2}(\mathrm{~g})$ | $+$ | $\mathrm{O}_{2}(\mathrm{~g})$ | $\longrightarrow$ | $2 \mathrm{H}_{2} \mathrm{O}(l)$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Molecules: | 2 molecules $\mathrm{H}_{2}$ | $+$ | 1 molecule $\mathrm{O}_{2}$ | $\longrightarrow$ | 2 molecules $\mathrm{H}_{2} \mathrm{O}$ |
|  |  |  | (3) |  |  |
| Mass (amu): | 4.0 amu H 2 | + | $32.0 \mathrm{amu} \mathrm{O}_{2}$ | $\rightarrow$ | 36.0 amu $\mathrm{H}_{2} \mathrm{O}$ |
| Amount (mol): | 2 mol H | $+$ | 1 mol O 2 | $\longrightarrow$ | $2 \mathrm{~mol} \mathrm{H} \mathrm{H}_{2}$ |
| Mass (g): | $4.0 \mathrm{~g} \mathrm{H}_{2}$ | + | $32.0 \mathrm{~g} \mathrm{O}_{2}$ | $\rightarrow$ | $36.0 \mathrm{~g} \mathrm{H}_{2} \mathrm{O}$ |

The coefficients in the balanced equation give the ratio of moles of reactants and products

## Stoichiometric Calculations <br> $\mathrm{A}_{(\mathrm{g})}+2 \mathrm{~B}_{(\mathrm{g})} \longrightarrow \mathrm{C}_{(\mathrm{g})}+2 \mathrm{D}_{(\mathrm{g})}$

Given:

## Stoichiometric Calculations

Example: 10 grams of glucose $\left(\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}\right)$ react in a combustion reaction with excess oxygen. How many grams of each product are produced?

$$
\begin{aligned}
\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6(\mathrm{~s})}+6 \mathrm{O}_{2(\mathrm{~g})} & \rightarrow 6 \mathrm{CO}_{2(\mathrm{~g})}+6 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \\
10 . \mathrm{g} & \longrightarrow ?+?
\end{aligned}
$$

Starting with 10. g of $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6} \ldots$

1. calculate the moles of $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6} \ldots$
2. use the coefficients to find the moles of $\mathrm{H}_{2} \mathrm{O} \& \mathrm{CO}_{2}$
3. then turn the moles to grams of $\mathrm{H}_{2} \mathrm{O} \& \mathrm{CO}_{2}$

## Stoichiometric calculations

$$
\begin{array}{llll} 
& \mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}+6 \mathrm{O}_{2} & \rightarrow 6 \mathrm{CO}_{2} & +6 \mathrm{H}_{2} \mathrm{O} \\
10 . \mathrm{g} & & \longrightarrow & ? \\
\text { MW: } 180 \mathrm{~g} / \mathrm{mol} & & & ? \\
44 \mathrm{~g} / \mathrm{mol} & & \text { 18g/mol. 1. (what 's known) }
\end{array}
$$

How many grams of oxygen reacted?

## Stoichiometric calculations

How many grams of oxygen reacted?

## Stoichiometric calculations

How many grams of oxygen reacted?

## Stoichiometric calculations

How many grams of oxygen reacted?

## Stoichiometric calculations

How many grams of oxygen reacted?
$15+5.9-10=10.9 \mathrm{~g}$

$$
\begin{gathered}
\text { Limiting } \\
\text { Reactants }
\end{gathered}
$$

## How Many Cookies Can I Make?

- You can make cookies until you run out of one of the ingredients
- Once you run out of sugar, you will stop making cookies

## How Many Cookies Can I Make?

- In this example the sugar would be the limiting reactant, because it will limit the amount of cookies you can make

## Limiting Reactants

- The limiting reactant is the reactant present in the smallest stoichiometric amount

Before reaction

$10 \mathrm{H}_{2}$ and $7 \mathrm{O}_{2}$
\#moles

Left:

14
10
0

After reaction

$10 \mathrm{H}_{2} \mathrm{O}$ and $2 \mathrm{O}_{2}$
$2 \mathrm{H}_{2}+\mathrm{O}_{2}$-------> $2 \mathrm{H}_{2} \mathrm{O}$

10
10

## Limiting Reactants

## In the example below, the $\mathrm{O}_{2}$ would be the excess reagent

Before reaction

$10 \mathrm{H}_{2}$ and $7 \mathrm{O}_{2}$

After reaction

$10 \mathrm{H}_{2} \mathrm{O}$ and $2 \mathrm{O}_{2}$

## Limiting reagent, example:

Soda fizz comes from sodium bicarbonate and citric acid $\left(\mathrm{H}_{3} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}_{7}\right)$ reacting to make carbon dioxide, sodium citrate $\left(\mathrm{Na}_{3} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}_{7}\right)$ and water. If 1.0 g of sodium bicarbonate and 1.0 g citric acid are reacted, which is limiting? How much carbon dioxide is produced?

| $3 \mathrm{NaHCO}_{3(a q)}+$ | $\mathrm{H}_{3} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}_{7(\mathrm{aq})}-\cdots--->$ | $3 \mathrm{CO}_{2}(\mathrm{~g})+3 \mathrm{H}_{2} \mathrm{O}(\mathrm{I})+\mathrm{Na}_{3} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}_{7}(\mathrm{aq})$ |  |
| :--- | :--- | :--- | :--- |
| 1.0 g | 1.0 g |  |  |
| $84 \mathrm{~g} / \mathrm{mol}$ | $192 \mathrm{~g} / \mathrm{mol}$ | $44 \mathrm{~g} / \mathrm{mol}$. | (knowns) |

## Limiting reagent, example:

Soda fizz comes from sodium bicarbonate and citric acid $\left(\mathrm{H}_{3} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}_{7}\right)$ reacting to make carbon dioxide, sodium citrate $\left(\mathrm{Na}_{3} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}_{7}\right)$ and water. If 1.0 g of sodium bicarbonate and 1.0 g citric acid are reacted, which is limiting? How much carbon dioxide is produced?

| $3 \mathrm{NaHCO}_{3(\text { aq })}+$ | $\mathrm{H}_{3} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}_{7(\text { aq })}----->$ | $3 \mathrm{CO}_{2}(\mathrm{~g})+$ | $3 \mathrm{H}_{2} \mathrm{O}(\mathrm{I})+\mathrm{Na}_{3} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}_{7}(\mathrm{aq})$ |
| :--- | :--- | :--- | :--- |
| 1.0 g | 1.0 g |  |  |
| $84 \mathrm{~g} / \mathrm{mol}$ | $192 \mathrm{~g} / \mathrm{mol}$ | $44 \mathrm{~g} / \mathrm{mol}$. | (knowns) |
| $1.0 \mathrm{~g}(1 \mathrm{~mol} / 84 \mathrm{~g})$ | $1.0 \mathrm{~g}(1 \mathrm{~mol} / 192 \mathrm{~g})$ |  |  |
| 0.012 mol | 0.0052 mol |  | (calculate moles) |

## Limiting reagent, example:

Soda fizz comes from sodium bicarbonate and citric acid $\left(\mathrm{H}_{3} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}_{7}\right)$ reacting to make carbon dioxide, sodium citrate $\left(\mathrm{Na}_{3} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}_{7}\right)$ and water. If 1.0 g of sodium bicarbonate and 1.0 g citric acid are reacted, which is limiting? How much carbon dioxide is produced?

| $3 \mathrm{NaHCO}_{3(\text { aq })}+$ | $\mathrm{H}_{3} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}_{7(\text { aq })}-\cdots--->$ | $3 \mathrm{CO}_{2}(\mathrm{~g})+3 \mathrm{H}_{2} \mathrm{O}(\mathrm{I})+\mathrm{Na}_{3} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}_{7}(\mathrm{aq})$ |
| :--- | :--- | :---: |
| 1.0 g | 1.0 g |  |
| $84 \mathrm{~g} / \mathrm{mol}$ | $192 \mathrm{~g} / \mathrm{mol}$ | $44 \mathrm{~g} / \mathrm{mol}$. (knowns) |
| $1.0 \mathrm{~g}(1 \mathrm{~mol} / 84 \mathrm{~g})$ | $1.0 \mathrm{~g}(1 \mathrm{~mol} / 192 \mathrm{~g})$ |  |
| 0.012 mol | 0.0052 mol | (calculate moles) |

(Make an assumption)
(if citrate limiting)
$0.0052(3)=0.016$ moles bicarbonate, but only have 0.012 moles
Bummer, wrong assumption.

## Limiting reagent, example:

Soda fizz comes from sodium bicarbonate and citric acid $\left(\mathrm{H}_{3} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}_{7}\right)$ reacting to make carbon dioxide, sodium citrate $\left(\mathrm{Na}_{3} \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}_{7}\right)$ and water. If 1.0 g of sodium bicarbonate and 1.0 g citric acid are reacted, which is limiting? How much carbon dioxide is produced?

```
3NaHCO
```

1.0 g
$84 \mathrm{~g} / \mathrm{mol}$
$1.0 \mathrm{~g}(1 \mathrm{~mol} / 84 \mathrm{~g}) \quad 1.0 \mathrm{~g}(1 \mathrm{~mol} / 192 \mathrm{~g})$
0.012 mol
$192 \mathrm{~g} / \mathrm{mol} \quad 44 \mathrm{~g} / \mathrm{mol}$
(if citrate limiting)
$0.0052(3)=0$.
So bicarbonate limiting:
0.012 mol
$0.012(1 / 3)=.0040 \mathrm{~mol} \quad 0.012$ moles $\mathrm{CO}_{2}$
$44 \mathrm{~g} / \mathrm{mol}(0.012 \mathrm{~mol})=0.53 \mathrm{~g} \mathrm{CO}_{2}$
.0052-.0040=.0012mol left
$0.0012 \mathrm{~mol}(192 \mathrm{~g} / \mathrm{mol})=$ 0.23 g left .

## Theoretical Yield

- The theoretical yield is the amount of product that can be made
- In other words it's the amount of product possible from stoichiometry. The "perfect reaction."
- The actual yield is the amount actually produced.

## Percent Yield

A comparison of the amount actually obtained to the amount it was possible to make

Percent Yield $=\frac{\text { Actual Yield }}{\text { Theoretical Yield }} \times 100$

## Example

Benzene $\left(\mathrm{C}_{6} \mathrm{H}_{6}\right)$ reacts with Bromine to produce bromobenzene $\left(\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{Br}\right)$ and hydrobromic acid. If 30 g of benzene reacts with 65 g of bromine and produces 56.7 g of bromobenzene, what is the percent yield of the reaction?

| $\mathrm{C}_{6} \mathrm{H}_{6}$ | $\mathrm{Br}_{2}$------> | $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{Br}$ | + HBr |
| :---: | :---: | :---: | :---: |
| 30.9 | 65 g | 56.7 g | (knowns) |
| $78 \mathrm{~g} / \mathrm{mol}$ | $160 . \mathrm{g} / \mathrm{mol}$ | 157g/mol |  |
| $30 . \mathrm{g}(1 \mathrm{~mol} / 78 \mathrm{~g})$ | $65 \mathrm{~g}(1 \mathrm{~mol} / 160 \mathrm{~g})$. |  |  |
| 0.38 mol | 0.41 mol |  | (moles) |
| (If $\mathrm{Br}_{2}$ limiting) |  |  |  |
| 0.41 mor | 0.41 mol |  | (assumption) |
| (If $\mathrm{C}_{6} \mathrm{H}_{6}$ limiting) |  |  |  |
| 0.38 mol | 0.38 mol | $0.38 \mathrm{~mol}(1$ $56.7 \mathrm{~g} / 60$ | $7 \mathrm{~g} / 1 \mathrm{~mol})=60 . \mathrm{g}$ $(100)=94.5 \%=95 \%$ |

## Example, one more

React 1.5 g of $\mathrm{NH}_{3}$ with 2.75 g of $\mathrm{O}_{2}$. How much NO and $\mathrm{H}_{2} \mathrm{O}$ is produced? What is left?

| $4 \mathrm{NH}_{3}+$ | $5 \mathrm{O}_{2}$-------> | 4NO | + | $6 \mathrm{H}_{2} \mathrm{O}$ |
| :---: | :---: | :---: | :---: | :---: |
| 1.5 g | 2.75 g | ? |  | ? |
| $17 \mathrm{~g} / \mathrm{mol}$ | $32 \mathrm{~g} / \mathrm{mol}$ | $30 . \mathrm{g} / \mathrm{mol}$ |  | $18 \mathrm{~g} / \mathrm{mol}$ |
| $1.5 \mathrm{~g}(1 \mathrm{~mol} / 17 \mathrm{~g})=$ | $2.75 \mathrm{~g}(1 \mathrm{~mol} / 32 \mathrm{~g})=$ |  |  |  |
| . 088 mol | . 086 |  |  |  |
| (If $\mathrm{NH}_{3}$ limiting): .088 mol | .088(5/4)= $/$ / |  |  |  |

$\mathrm{O}_{2}$ limiting:

| $.086(4 / 5)=$ | .086 mol | $.086 \mathrm{~mol}(4 / 5)=$ | $.086(6 / 5)=$ |
| :--- | :--- | :--- | :--- |
| .069 mol |  | .069 mol | .10 mol |
| $.069 \mathrm{~mol}(17 \mathrm{~g} / \mathrm{mol})$ |  | $.069 \mathrm{~mol}(30 . \mathrm{g} / \mathrm{mol})$ | $.10 \mathrm{~mol}(18 \mathrm{~g} / \mathrm{mol})$ |
| 1.2 g | 2.75 g | $\mathbf{2 . 1 \mathrm { g }}$ | $\mathbf{1 . 8 \mathrm { g }}$ |

$1.5 \mathrm{~g}-1.2 \mathrm{~g}=.3 \mathrm{~g}$

## Barking Dog

$2 \mathrm{HNO}_{3}+2 \mathrm{Cu}----->\mathrm{NO}+\mathrm{NO}_{2}+2 \mathrm{Cu}^{2+}+2 \mathrm{H}^{+}$
$3 \mathrm{NO}+\mathrm{CS}_{2}->3 / 2 \mathrm{~N}_{2}+\mathrm{CO}+\mathrm{SO}_{2}+1 / 8 \mathrm{~S}_{8}$
$4 \mathrm{NO}+\mathrm{CS}_{2}->2 \mathrm{~N}_{2}+\mathrm{CO}_{2}+\mathrm{SO}_{2}+1 / 8 \mathrm{~S}_{8}$

## Gun powder reaction

$10 \mathrm{KNO}_{3(\mathrm{~s})}+3 \mathrm{~S}_{(\mathrm{s})}+8 \mathrm{C}_{(\mathrm{s})}--->2 \mathrm{~K}_{2} \mathrm{CO}_{3(\mathrm{~s})}+3 \mathrm{~K}_{2} \mathrm{SO}_{4(\mathrm{~s})}+6 \mathrm{CO}_{2(\mathrm{~g})}+5 \mathrm{~N}_{2(\mathrm{~g})}$ Salt peter sulfur charcoal And heat.

What is interesting about this reaction?
What kind of reaction is it?
What do you think makes it so powerful?

## Gun powder reaction

| Oxidizing <br> agent | Oxidizing <br> agent | Reducing <br> agent |
| :--- | :--- | :--- |
| $10 \mathrm{KNO}_{3(\mathrm{~s})}$ | $+3 \mathrm{~S}_{(\mathrm{s})}+8 \mathrm{C}_{(\mathrm{s})} \ldots--->$ | $2 \mathrm{~K}_{2} \mathrm{CO}_{3(\mathrm{~s})}+3 \mathrm{~K}_{2} \mathrm{SO}_{4(\mathrm{~s})}+6 \mathrm{CO}_{2(\mathrm{~g})}+5 \mathrm{~N}_{2(\mathrm{~g})}$ |
| Salt peter | sulfur charcoal | And heat. |

What is interesting about this reaction?
Lots of energy, no oxygen
What kind of reaction is it?
Oxidation reduction
What do you think makes it so powerful and explosive?
Makes a lot of gas!!!!

White phosphorous and Oxygen under water

$2 \mathrm{Mg}_{(\mathrm{s})}+\mathrm{O}_{2(g)} \longrightarrow 2 \mathrm{MgO}_{(s)}$
