## Chapter 5 Thermochemistry

The energy of chemical reactions
How do you keep track of it? Where does it come from?

## Energy

- The ability to:
- do work
- transfer heat.
$>$ Work: Energy used to cause an object that has mass to move.
$>$ Heat: Energy used to cause the temperature of an object to rise.

## Units of Energy

- The SI unit of energy is the joule (J).

$$
1 \mathrm{~J}=1 \frac{\mathrm{~kg} \mathrm{~m}^{2}}{\mathrm{~s}^{2}}
$$

- An older, non-SI unit is still in widespread use: The calorie (cal).

$$
1 \mathrm{cal}=4.184 \mathrm{~J}
$$

Energy has units of (mass)(velocity) ${ }^{2}$
Remember kinetic energy was $1 / 2 \mathrm{mv}^{2}$

## Work

- Energy used to move an object over some distance.
- $w=F \cdot d$,

$$
w=\text { work, }
$$

$F=$ force
$d$ = distance over which the force is exerted.

Note units:
F = ma, mass(distance/s²)
$\mathrm{W}=\mathrm{F}(\mathrm{d})=\operatorname{mass}\left(\right.$ distance ${ }^{2} / \mathrm{s}^{2}$ )

(a)

(b)

## Heat

- Energy can also be transferred as heat.
- Heat flows from warmer objects to cooler objects.

## Kinetic Energy

Energy an object possesses by virtue of its motion.

$$
K E=\frac{1}{2} m v^{2}
$$

## Potential Energy

Energy an object possesses by virtue of its position or chemical composition.

More potential E
Less P.E. as bike goes down.

## Transferal of Energy

a) Add P.E. to a ball by lifting it to the top of the wall

## Transferal of Energy

a) Add P.E. to a ball by lifting it to the top of the wall
b) As the ball falls,
P.E ------> K. E. (1/2mv²)

## Transferal of Energy

a) Add P.E. to a ball by lifting it to the top of the wall
b) As the ball falls,
P.E ------> K. E. (1/2mv²)

Ball hits ground, K.E. $=0$, but E has to go somewhere. So

1. Ball gets squashed
2. Heat comes out.

## Energy accounting

- We must identify where different types of energy go.
- Therefore, we must identify the places.

## Sysłem and Surroundings

- The system includes the molecules we want to study (here, the hydrogen and oxygen molecules).
- The surroundings are everything else (here, the cylinder and piston).

## First Law of Thermodynamics

- Energy is conserved.
- In other words, the total energy of the universe is a constant;
$\Delta \mathrm{E}_{\text {system }}=-\Lambda \mathrm{E}_{\text {surroundings }}$

Energy lost to surroundings

Energy gained from surroundings

## Internal Energy

The internal energy of a system is the sum of all kinetic and potential energies of all components of the system; we call it $E$.
$\mathrm{E}_{\text {internal,total }}=\mathrm{E}_{\mathrm{KE}}+\mathrm{E}_{\mathrm{PE}}+\mathrm{E}_{\text {electrons }}+\mathrm{E}_{\text {nuclei }}+\ldots .$.
Almost impossible to calculate total internal energy
Instead we always look at the change in energy ( $\Delta \mathrm{E}$ ).

## Internal Energy

By definition, the change in internal energy, $\Delta E$, is the final energy of the system minus the initial energy of the system:

$$
\Delta E=E_{\text {final }}-E_{\text {initial }}
$$

## Changes in Internal Energy

- If $\Delta E>0, E_{\text {final }}>E_{\text {initial }}$
$>$ Therefore, the system absorbed energy from the surroundings.
$>$ This energy change is called endergonic.

## Changes in Internal Energy

- If $\Delta E<0, E_{\text {final }}<E_{\text {initial }}$
$>$ Therefore, the system released energy to the surroundings.
$\Rightarrow$ This energy change is called exergonic.

## Changes in Internal Energy

System
Heat $q>0$

Surroundings

Work $w>0$

- When energy is exchanged between the system and the surroundings, it is exchanged as either heat ( $q$ ) or work ( $w$ ).
- That is, $\Delta E=q+w$.
$\Delta E>0$

## $\Delta E, q, w$, and Their Signs

For $q \quad+$ means system gains heat For $w \quad+$ means work done on system - means work done by system For $\Delta E+$ means net gain of energy by system - means net loss of energy by system

Surroundings suck heat out of water.
hot plate adds
heat to water

## Sign of work

block pushes truck down does work on truck
$\mathrm{W}_{\text {block }}{ }^{-}$

Truck pushes block up. Does work on block
$\mathrm{W}_{\text {truck }}{ }^{-}$
$W_{\text {block }}{ }^{+}$

## Exchange of Heat between Sysłem and Surroundings

- When heat is absorbed by the system from the surroundings, the process is endothermic.

## Surroundings

## Exchange of Heat between Sysłem and Surroundings

- Heat absorbed by system from surroundings, is endothermic.
- Heat released by system to surroundings, the is exothermic.

Surroundings

## State Functions

Total internal energy of a system:
K.E. $+\mathrm{E}_{\text {electrons }}+\mathrm{E}_{\text {nucleus }}+$ P. $\mathrm{E}_{\text {.total }}$
virtually impossible to measure/calculate

## State Functions

- However, we do know that the internal energy of a system is independent of the path by which the system achieved that state.
$>$ In the system below, the water could have reached room temperature from either direction.

Copyright © 2006 Pearson Prentice Hall, Inc.

## State Functions

- Therefore, internal energy is a state function.
- because it's PATH INDEPENDENT
- And so, $\Delta E$ depends only on $E_{\text {initial }}$ and $E_{\text {final }}$.

Copyright © 2006 Pearson Prentice Hall, Inc.

## State Functions

- However, $q$ and $w$ are not state functions.
- Whether the battery is shorted out or is discharged by running the fan, its $\Delta E$ is the same.
$>$ But $q$ and $w$ are different in the two cases.

## Work

process in an open container (chemical reaction in a beaker) w? (can there be any work)?
Yes, evolving gases could push on the surroundings.

Catch the work, do the same process in a cylinder

Process evolves gas, pushes on piston, work done on piston

Catch the work, do the same process in a cylinder

## Example

- Gas inside cylinder with electric heater.
- Add 100 j heat with heater.
- 1. Piston can go up and down
- 2. Piston stuck.
- a. What happens to T in each case?
- b. What about q and w for each case?
- c. What about $\Delta \mathrm{E}$ in each case?
- Gas inside cyclinder with electric heater.
- Add 100 j heat with heater.
- 1. Piston can go up and down
- 2. Piston stuck.
- a. What happens to $T$ in each case?
- b. What about $q$ and $w$ for each case?
- c. What about $\Delta \mathrm{E}$ in each case?

a.1. Piston goes up, some $E$ goes to expand gas, do work. T goes up less
a. 2 T goes up more, all E goes to $q$.
b.1. both $q$ and $w$ positive
b.2. w 0 , q larger
c. $\Delta E$ the same $\&+$ in each case
b.2. w 0 , q larger
c. $\Delta E$ the same $\&+$ in each case

## Example

## Work

Now we can measure the work:

$$
w=-P \Delta V
$$

$\mathrm{Zn}+2 \mathrm{HCl}------->\mathrm{H}_{\mathbf{2 ( g )}}+\mathrm{ZnCl}_{2}$

## Work

$\mathrm{Zn}+2 \mathrm{HCl} \cdots \mathrm{H}_{\mathbf{2 ( g )}}+\mathrm{ZnCl}_{2}$
I mole of Zn reacts. How much work is done ( $\mathrm{P}=1 \mathrm{~atm}$, density of $\left.\mathrm{H}_{2}=0.0823 \mathrm{~g} / \mathrm{L}\right)$ ?
1 mole of $\mathrm{H}_{2}$ is produced.

## Work

$\mathrm{H}_{2}$ gas
plus original atmosphere

I mole of Zn reacts. How much work is done ( $\mathrm{P}=1$ atm, density of $\mathrm{H}_{2}=$ $0.0823 \mathrm{~g} / \mathrm{L}$ )?
1 mole of $\mathrm{H}_{2}$ is produced.

| $\mathrm{Zn}+2 \mathrm{HCl}$ | $\mathrm{H}_{(\mathrm{g})}+\mathrm{ZnCl}_{2}$ |
| :--- | :--- |
| 1 mol | 1 mol |
|  | $2.014 \mathrm{~g} / \mathrm{mol}$ |
|  | 2.014 g |
|  | $\mathrm{~d}=\mathrm{m} / \mathrm{V}$ |
|  | $\mathrm{V}=\mathrm{m} / \mathrm{d}$ |
|  | $\mathrm{V}=2.014 \mathrm{~g} / 0.0823 \mathrm{~g} / \mathrm{L}=24.47 \mathrm{~L}$ |

$W=-P \Delta V=1 \operatorname{atm}(24.47 \mathrm{~L})=-24.47 \mathrm{~L}(\mathrm{~atm})$

## Enthalpy(H)

$$
H=E+P V
$$

This is the definition of Enthalpy for any process Buy why do we care?

## Enthalpy

$$
H=E+P V
$$

- at constant pressure, $\Delta H$, is ( $\Delta=$ change in thermodynamics)

$$
\Delta H=\Delta(E+P V)
$$

- This can be written (if P constant)

$$
\Delta H=\Delta E+P \Delta V
$$

## Enthalpy

- Since $\Delta E=q+w$ and $w=-P \Delta V$ ( $P$ const.) substitute these into the enthalpy expression:

$$
\begin{aligned}
& \Delta H=\Delta E+P \Delta V \\
& \Delta H=(q+w)-w \\
& \Delta H=q
\end{aligned}
$$

- Note: true at constant pressure
- q is a state function at const P \& only PV work.

## $H=E+P V$

- Because:
- If pressure is constant (like open to atmosphere, i.e. most things) and
$\mathrm{w}=\Delta \mathrm{PV}$.
heat flow $(q)=H$ (enthalpy) of system.
And: H is a state function, so q is also.
but only in the right conditions

## Endothermic vs. Exothermic

## Endothermicity and Exothermicity

## Enthalpies of Reaction

The change in enthalpy, $\Delta H$, is the enthalpy of the products minus the enthalpy of the reactants:

$$
\Delta H=H_{\text {products }}-H_{\text {reactants }}
$$

## Enthalpies of Reaction

This quantity, $\Delta H$, is called the enthalpy of reaction, or the heat of reaction.

## Reaction Enthalpy summary

1. Enthalpy is an extensive property.
2. $\Delta H$ for a reaction in the forward direction is equal in size, but opposite in sign, to $\Delta H$ for the reverse reaction.
3. $\Delta H$ for a reaction depends on the state of the products and the state of the reactants.

## Enthalpy of reaction example

Consider the reaction:
$2 \mathrm{KClO}_{3}------>2 \mathrm{KCl}+3 \mathrm{O}_{2} \quad \Delta \mathrm{H}=-89.4 \mathrm{~kJ} / \mathrm{mol}$
a. What is the enthalpy change for formation of 0.855 moles of $\mathrm{O}_{2}$ ?

## Enthalpy of reaction example

Consider the reaction:
$2 \mathrm{KClO}_{3}------>2 \mathrm{KCl}+3 \mathrm{O}_{2} \quad \Delta \mathrm{H}=-89.4 \mathrm{~kJ} / \mathrm{mol}$
a. What is the enthalpy change for formation of 0.855 moles of $\mathrm{O}_{2}$ ?
$2 \mathrm{KClO}_{3}----->2 \mathrm{KCl}+3 \mathrm{O}_{2} \quad \Delta \mathrm{H}=-89.4 \mathrm{~kJ} / \mathrm{mol}$ 0.855 mol

$$
\begin{aligned}
& \Delta \mathrm{H}=-89.4 \mathrm{~kJ} / 3 \mathrm{~mol} \mathrm{O}_{2}\left(.855 \mathrm{~mol} \mathrm{O}_{2}\right)= \\
&-25.5 \mathrm{~kJ}
\end{aligned}
$$

## Calorimetry

Since we cannot know the exact enthalpy of the reactants and products,
we measure $\Delta H$ through calorimetry, the measurement of heat flow.

## Heat Capacity and Specific Heat

- heat capacity: amount of E required to raise the temperature of something by 1 K
- specific heat: amount of $E$ required to raise the temperature of 1 g of a substance by 1 K .

## Heat Capacity and Specific Heat

Specific heat is:

## heat transferred <br> Specific heat $=$ <br> mass $\times$ temperature change

$$
\begin{aligned}
& s=\frac{q}{m \Delta T} \\
& s m \Delta T=q
\end{aligned}
$$

## Consłanł Pressure Calorimełry

indirectly measure the heat change for the system by measuring the heat change for the water in the calorimeter.

Two Styrofoam ${ }^{\circledR}$
cups nested
together containing reactants in solution

## Consłant Pressure Calorimetry

## Example

When a 3.88 g sample of solid ammonium nitrate disolves in 60.0 g of water in a coffee cup calorimeter, the temperature drops from $23.0^{\circ} \mathrm{C}$ to $18.4^{\circ} \mathrm{C}$. (a) Calculate $\Delta \mathrm{H}$ (in kJ/ mol ammonium nitrate) for the solution process. Assume that the specific heat is constant and $=1.0$ $\mathrm{cal} / \mathrm{gC}$. (b) Is this process endothermic or exothermic?

Two Styrofoam ${ }^{\circledR}$ cups nested together containing reactants in solution

## Example

When a 3.88 g sample of solid ammonium nitrate disolves in 60.0 g of water in a coffee cup calorimeter, the temperature drops from $23.0^{\circ} \mathrm{C}$ to $18.4^{\circ} \mathrm{C}$. (a) Calculate $\Delta \mathrm{H}$ (in $\mathrm{kJ} / \mathrm{mol}$ ammonium nitrate) for the solution process. Assume that the specific heat is constant and $=4.184 \mathrm{~J} / \mathrm{g}^{\circ} \mathrm{C}$. (b) Is this process endothermic or exothermic?
Reaction:
$\mathrm{NH}_{4} \mathrm{NO}_{3}(\mathrm{~s}) \quad----->\mathrm{NH}_{4}{ }^{+}(\mathrm{aq})+\mathrm{NO}_{3}{ }^{-}(\mathrm{aq})$
gr $\quad 3.88 \mathrm{~g}$
MW $\quad 80.04 \mathrm{~g} / \mathrm{mol}$
\#Mol $3.88 \mathrm{~g} / 80.04 \mathrm{~g} / \mathrm{mol}=0.0484 \mathrm{~mol}$
Mass of solution $=3.88 \mathrm{~g}+60 \mathrm{~g}=63.88 \mathrm{~g}$. System: Solid $\mathrm{AmNO}_{3}$ Surroundings: Solution
$\mathrm{q}=\mathrm{s}($ specific heat) m (mass) $\Delta \mathrm{T}$
$q=s\left(J / g^{\circ} \mathrm{C}\right) m($ grams $)\left(\mathrm{T}_{\text {final }}-\mathrm{T}_{\text {initial }}\right)$
$q_{\text {solution }}=4.184\left(\mathrm{~J} / \mathrm{g}^{\circ} \mathrm{C}\right)(63.88 \mathrm{~g})\left(18.4^{\circ} \mathrm{C}-23.0^{\circ} \mathrm{C}\right)=-1229 \mathrm{~J}$
$\mathrm{q}_{\text {water }}=-\mathrm{q}_{\text {ammonium nitrate }}=+1229 \mathrm{~J}$
$\Delta H\left(\right.$ per mol $\left.\mathrm{NH}_{4} \mathrm{NO}_{3}\right)=1.229 \mathrm{~kJ} / .0484 \mathrm{~mol}=25.39 \mathrm{~kJ} / \mathrm{mol}$
(b) Endothermic

## Bomb Calorimetry

Reactions can be carried out separated from the water in a "bomb," such as this one,

And still measure the heat absorbed by the water.

## Bomb Calorimetry

- Because the volume in the bomb calorimeter is constant, what is measured is really the $\Delta E$, not $\Delta H$.
- For most reactions,
- $\Delta E \approx \Delta H$
- Why?

## Bomb Calorimetry

$\mathrm{H}=\mathrm{E}+\mathrm{PV}$
$\Delta H=\Delta E+\Delta P V$

In a bomb calorimeter, $\Delta \mathrm{V}=0$
For a process that doesn' t evolve gas: $\Delta \mathrm{P} \approx 0$ as well.
$\Delta \mathrm{H}=\Delta \mathrm{E}+\Delta \mathrm{PV}=\Delta \mathrm{E}$

## Example

- A 50 g sample of gasoline was burned by combustion (with excess oxygen) in a calorimeter with a heat capacity of $10 \mathrm{~kJ} /{ }^{\circ} \mathrm{C}$. The temperature increased by $100{ }^{\circ} \mathrm{C}$. Calculate the change in E per g of gasoline.
- $\mathrm{q}_{\text {surroundings }}=\mathrm{C} \Delta \mathrm{T}=10 \mathrm{~kJ} /{ }^{\circ} \mathrm{C}\left(100^{\circ} \mathrm{C}\right)=1000 \mathrm{~kJ}$
- $q_{\text {surroundings }}=-q_{\text {system }}$
- $\mathrm{q}_{\text {system }}=-1000$
- $-1000 \mathrm{~kJ} / 50 \mathrm{~g}=-20 \mathrm{~kJ} / \mathrm{g}$
- Does $\Delta \mathrm{E}=\Delta \mathrm{H}$ in this case?

## Example

- A 50 g sample of gasoline was burned by combustion (with excess oxygen) in a calorimeter with a heat capacity of $10 \mathrm{~kJ} /{ }^{\circ} \mathrm{C}$. The temperature increased $100^{\circ} \mathrm{C}$. Calculate the change in E per g of gasoline.
- $\mathrm{q}_{\text {surroundings }}=\mathrm{C} \Delta \mathrm{T}=10 \mathrm{~kJ} /{ }^{\circ} \mathrm{C}\left(100^{\circ} \mathrm{C}\right)=1000 \mathrm{~kJ}$
- $q_{\text {surroundings }}=-q_{\text {system }}$
- $\mathrm{q}_{\text {system }}=-1000$
- $-1000 \mathrm{~kJ} / 50 \mathrm{~g}=-20 \mathrm{~kJ} / \mathrm{g}$
- Does $\Delta \mathrm{E}=\Delta \mathrm{H}$ in this case?
- NO! Pressure can't stay constant in this case.

## Hess's Law

- $\Delta H$ is known for many reactions.
- measuring $\Delta H$ can be a pain
- Can we estimate $\Delta H$ using $\Delta H$ values for other reactions?

## Hess's Law

## $\mathrm{CH}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g})$

## Yes!

Hess' s law: states that:
$\Delta H$ for the overall reaction will be equal to the sum of the enthalpy changes for the individual steps.

## Hess's Law

Why?
Because $\Delta H$ is a state function, and is pathway independent.
Only depends on initial state of the reactants and the final state of the products.

## Hess' s law, example:

- Given:
- $\mathrm{N}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g})$----> $2 \mathrm{NO}(\mathrm{g}) \quad \Delta \mathrm{H}=180.7 \mathrm{~kJ}$
- $2 \mathrm{NO}(\mathrm{g})+\mathrm{O}_{2}(\mathrm{~g})$----> $2 \mathrm{NO}_{2}(\mathrm{~g}) \Delta \mathrm{H}=-113.1 \mathrm{~kJ}$
- $2 \mathrm{~N}_{2} \mathrm{O}(\mathrm{g})$----> $2 \mathrm{~N}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \Delta \mathrm{H}=-163.2 \mathrm{~kJ}$
- use Hess' s law to calculate $\Delta \mathrm{H}$ for the reaction:
- $\mathrm{N}_{2} \mathrm{O}(\mathrm{g})+\mathrm{NO}_{2}(\mathrm{~g})$----> $3 \mathrm{NO}(\mathrm{g})$

## Hess' s law, example:

- Given:
- $\mathrm{N}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g})$----> $2 \mathrm{NO}(\mathrm{g}) \Delta \mathrm{H}=180.7 \mathrm{~kJ}$
- $2 \mathrm{NO}(\mathrm{g})+\mathrm{O}_{2}(\mathrm{~g})--->2 \mathrm{NO}_{2}(\mathrm{~g}) \quad \Delta \mathrm{H}=-113.1 \mathrm{~kJ}$
- $2 \mathrm{~N}_{2} \mathrm{O}(\mathrm{g})$----> $2 \mathrm{~N}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) \quad \Delta \mathrm{H}=-163.2 \mathrm{~kJ}$
- use Hess' s law to calculate $\Delta \mathrm{H}$ for the reaction:
- $\mathrm{N}_{2} \mathrm{O}(\mathrm{g})+\mathrm{NO}_{2}(\mathrm{~g})$----> $3 \mathrm{NO}(\mathrm{g})$

| $\cdot \mathrm{N}_{2} \mathrm{O}(\mathrm{g})$ | $---->\mathrm{N}_{2}(\mathrm{~g})+1 \not \mathrm{HO}_{2}(\mathrm{~g}) \Delta \mathrm{H}=-163.2 / 2=-81.6 \mathrm{~kJ}$ |  |
| :--- | :--- | :--- |
| $\cdot \mathrm{NO}_{2}(\mathrm{~g})$ | $---->\mathrm{NO}(\mathrm{g})+12 \mathrm{O}_{2}(\mathrm{~g})$ | $\Delta \mathrm{H}=113.1 \mathrm{~kJ} / 2=56.6 \mathrm{~kJ}$ |
| $\cdot \mathrm{~N}_{2}(\mathrm{~g})+\Omega_{2}(\mathrm{~g})$ | $--->2 \mathrm{NO}(\mathrm{g})$ | $\Delta \mathrm{H}=$ |

- $\mathrm{N}_{2} \mathrm{O}(\mathrm{g})+\mathrm{NO}_{2}(\mathrm{~g})$----> $3 \mathrm{NO}(\mathrm{g})$
$\Delta \mathrm{H}=$
155.7 kJ

## Enthalpies of Formation

An enthalpy of formation, $\Delta H_{f}$, is defined as the $\Delta H$ for the reaction in which a compound is made from its constituent elements in their most stable elemental forms.

- $2 \mathrm{Al}+\mathrm{Fe}_{2} \mathrm{O}_{3}------->\mathrm{Al}_{2} \mathrm{O}_{3}+2 \mathrm{Fe}$
-What is the heat of reaction given:
$\cdot 2 \mathrm{Fe}+3 / 2 \mathrm{O}_{2}$-----> $\mathrm{Fe}_{2} \mathrm{O}_{3}$
$\Delta \mathrm{H}=-825.5 \mathrm{KJ}$ (heat of formation)
$\cdot 2 \mathrm{Al}+3 / 2 \mathrm{O}_{2}$-----> $\mathrm{Al}_{2} \mathrm{O}_{3}$
$\Delta H=-1675.7 \mathrm{KJ}$ (heat of formation)

## Calculation of $\Delta H$

## $\mathrm{C}_{3} \mathrm{H}_{8}(\mathrm{~g})+5 \mathrm{O}_{2}(\mathrm{~g}) \longrightarrow 3 \mathrm{CO}_{2}(\mathrm{~g})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$

- Imagine this as occurring in 3 steps:
$\mathrm{C}_{3} \mathrm{H}_{8}(\mathrm{~g}) \longrightarrow 3 \mathrm{C}_{(\text {graphite })}+4 \mathrm{H}_{2}(\mathrm{~g})$ 喑

## Calculation of $\Delta H$

## $\mathrm{C}_{3} \mathrm{H}_{8}(g)+5 \mathrm{O}_{2}(g) \longrightarrow 3 \mathrm{CO}_{2}(g)+4 \mathrm{H}_{2} \mathrm{O}()$

- Imagine this as occurring in 3 steps:
$3 \mathrm{C}_{\text {(graphite) }}+3 \mathrm{O}_{2}(\mathrm{~g}) \longrightarrow 3 \mathrm{CO}_{2}(\mathrm{~g})$

## Calculation of $\Delta H$

## $\mathrm{C}_{3} \mathrm{H}_{8}(g)+5 \mathrm{O}_{2}(g) \longrightarrow 3 \mathrm{CO}_{2}(g)+4 \mathrm{H}_{2} \mathrm{O}(1)$

- Imagine this as occurring in 3 steps:
$\mathrm{C}_{3} \mathrm{H}_{8}(\mathrm{~g}) \longrightarrow 3 \mathrm{C}_{(\text {graphite })}+4 \mathrm{H}_{2}(\mathrm{~g})$
$3 \mathrm{C}_{\text {(graphite) }}+3 \mathrm{O}_{2}(\mathrm{~g}) \longrightarrow 3 \mathrm{CO}_{2}(\mathrm{~g})$
$4 \mathrm{H}_{2}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) \longrightarrow 4 \mathrm{H}_{2} \mathrm{O}(/)$

## Calculation of $\Delta H$

$$
\mathrm{C}_{3} \mathrm{H}_{8}(g)+5 \mathrm{O}_{2}(g) \longrightarrow 3 \mathrm{CO}_{2}(g)+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
$$

- The sum of these equations is:

$$
\begin{aligned}
& \mathrm{C}_{3} \mathrm{H}_{8}(\mathrm{~g}) \longrightarrow 3 \mathrm{E}_{\text {(graphite) }}+4 \mathrm{H}_{2}(\mathrm{~g}) \\
& 3 \mathrm{E}_{\text {(graphite) }}+3 \mathrm{O}_{2}(\mathrm{~g}) \longrightarrow 3 \mathrm{CO}_{2}(\mathrm{~g}) \\
& 4 \mathrm{H}_{2}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) \longrightarrow 4 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})
\end{aligned}
$$

$\mathrm{C}_{3} \mathrm{H}_{8}(\mathrm{~g})+5 \mathrm{O}_{2}(\mathrm{~g}) \longrightarrow 3 \mathrm{CO}_{2}(\mathrm{~g})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{I})$
Make each reactant or product from its elements This is called the heat of formation of a compound

## Calculation of $\Delta H$

We can use Hess' s law in this way:
$\Delta H=\Sigma n \Delta H_{f(\text { products })}^{\circ}-\Sigma m \Delta H_{f(\text { reactants })}^{\circ}$
where $n$ and $m$ are the stoichiometric coefficients.

## Standard Enthalpies of Formation

## Standard enthalpies of formation, $\Delta H_{f}$, are measured under standard conditions $\left(25^{\circ} \mathrm{C}\right.$ and 1.00 atm pressure).

| Substance | Formula | $\Delta H_{f}^{\circ}(\mathrm{kJ} / \mathrm{mol})$ | Substance | Formula | $\Delta H_{f}^{\circ}(\mathrm{kJ} / \mathrm{mol})$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Acetylene | $\mathrm{C}_{2} \mathrm{H}_{2}(\mathrm{~g})$ | 226.7 | Hydrogen chloride | $\mathrm{HCl}(\mathrm{g})$ | -92.30 |
| Ammonia | $\mathrm{NH}_{3}(\mathrm{~g})$ | -46.19 | Hydrogen fluoride | HF(g) | -268.60 |
| Benzene | $\mathrm{C}_{6} \mathrm{H}_{6}(l)$ | 49.0 | Hydrogen iodide | $\mathrm{HI}(\mathrm{g})$ | 25.9 |
| Calcium carbonate | $\mathrm{CaCO}_{3}(\mathrm{~s})$ | -1207.1 | Methane | $\mathrm{CH}_{4}(\mathrm{~g})$ | -74.80 |
| Calcium oxide | $\mathrm{CaO}(\mathrm{s})$ | -635.5 | Methanol | $\mathrm{CH}_{3} \mathrm{OH}(l)$ | -238.6 |
| Carbon dioxide | $\mathrm{CO}_{2}(\mathrm{~g})$ | -393.5 | Propane | $\mathrm{C}_{3} \mathrm{H}_{8}(\mathrm{~g})$ | -103.85 |
| Carbon monoxide | $\mathrm{CO}(\mathrm{g})$ | -110.5 | Silver chloride | $\mathrm{AgCl}(\mathrm{s})$ | -127.0 |
| Diamond | C (s) | 1.88 | Sodium bicarbonate | $\mathrm{NaHCO}_{3}(\mathrm{~s})$ | -947.7 |
| Ethane | $\mathrm{C}_{2} \mathrm{H}_{6}(\mathrm{~g})$ | -84.68 | Sodium carbonate | $\mathrm{Na}_{2} \mathrm{CO}_{3}(s) 1$ | - 130.9 |
| Ethanol | $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(l)$ | -277.7 | Sodium chloride | $\mathrm{NaCl}(\mathrm{s})$ | -410.9 |
| Ethylene | $\mathrm{C}_{2} \mathrm{H}_{4}(\mathrm{~g})$ | 52.30 | Sucrose | $\mathrm{C}_{12} \mathrm{H}_{22} \mathrm{O}_{11}(s)$ | -2221 |
| Glucose | $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}(\mathrm{~s})$ | -1273 | Water | $\mathrm{H}_{2} \mathrm{O}(l)$ | -285.8 |
| Hydrogen bromide | $\mathrm{HBr}(\mathrm{g})$ | -36.23 | Water vapor | $\mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ | -241.8 |

## Calculation of $\Delta \mathrm{H}$

- Calculate $\Delta \mathrm{H}$ using the table:
- $\mathrm{C}_{3} \mathrm{H}_{8(\mathrm{~g})}+5 \mathrm{O}_{2(\mathrm{~g})}---->3 \mathrm{CO}_{2(\mathrm{~g})}+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$

| Substance | Formula | $\Delta H_{f}^{\circ}(\mathrm{kJ} / \mathrm{mol})$ | Substance | Formula | $\Delta H_{f}^{\circ}(\mathrm{kJ} / \mathrm{mol})$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Acetylene | $\mathrm{C}_{2} \mathrm{H}_{2}(\mathrm{~g})$ | 226.7 | Hydrogen chloride | $\mathrm{HCl}(\mathrm{g})$ | -92.30 |
| Ammonia | $\mathrm{NH}_{3}(\mathrm{~g})$ | -46.19 | Hydrogen fluoride | HF(g) | -268.60 |
| Benzene | $\mathrm{C}_{6} \mathrm{H}_{6}(l)$ | 49.0 | Hydrogen iodide | $\mathrm{HI}(\mathrm{g})$ | 25.9 |
| Calcium carbonate | $\mathrm{CaCO}_{3}(\mathrm{~s})$ | -1207.1 | Methane | $\mathrm{CH}_{4}(\mathrm{~g})$ | -74.80 |
| Calcium oxide | $\mathrm{CaO}(\mathrm{s})$ | -635.5 | Methanol | $\mathrm{CH}_{3} \mathrm{OH}(\mathrm{l})$ | -238.6 |
| Carbon dioxide | $\mathrm{CO}_{2}(\mathrm{~g})$ | -393.5 | Propane | $\mathrm{C}_{3} \mathrm{H}_{8}(\mathrm{~g})$ | -103.85 |
| Carbon monoxide | $\mathrm{CO}(\mathrm{g})$ | -110.5 | Silver chloride | $\mathrm{AgCl}(\mathrm{s})$ | -127.0 |
| Diamond | C (s) | 1.88 | Sodium bicarbonate | $\mathrm{NaHCO}_{3}(\mathrm{~s})$ | -947.7 |
| Ethane | $\mathrm{C}_{2} \mathrm{H}_{6}(\mathrm{~g})$ | -84.68 | Sodium carbonate | $\mathrm{Na}_{2} \mathrm{CO}_{3}(\mathrm{~s}) 1$ | - 130.9 |
| Ethanol | $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}(l)$ | -277.7 | Sodium chloride | $\mathrm{NaCl}(\mathrm{s})$ | -410.9 |

## Calculation of $\Delta \mathrm{H}$

$$
\begin{aligned}
\bullet & \mathrm{C}_{3} \mathrm{H}_{8}+5 \mathrm{O}_{2}----->3 \mathrm{CO}_{2}+4 \mathrm{H}_{2} \mathrm{O} \\
\Delta \mathrm{H} & =\left[3\left(\Delta \mathrm{H}_{\mathrm{f}} \mathrm{CO}_{2}\right)+4\left(\Delta \mathrm{H}_{\mathrm{f}} \mathrm{H}_{2} \mathrm{O}\right)\right]-\left[\left(\Delta \mathrm{H}_{\mathrm{f}} \mathrm{C}_{3} \mathrm{H}_{8}\right)+\left(5 \Delta \mathrm{H}_{\mathrm{f}} \mathrm{O}_{2}\right)\right] \\
& =[3(-393.5 \mathrm{~kJ})+4(-285.8 \mathrm{~kJ})]-[(-103.85 \mathrm{~kJ})+5(0) \\
& =[-1180.5 \mathrm{~kJ}+(-1143.2 \mathrm{~kJ})]-[(-103.85 \mathrm{~kJ})+0 \mathrm{~kJ} \\
& =[-2323.7 \mathrm{kJJ}-[-103.85 \mathrm{~kJ}) \\
& =-2219.9 \mathrm{~kJ}
\end{aligned}
$$

## Phase Changes

- Conversion from
 one state of matter to another is a phase change.

Energy is either added or released in a phase change.

Endothermic process (energy added to substance)
Exothermic process (energy released from substance)

# Why is $E(Q, H)$ transferred in phase 

## change?

Strength of intermolecular attractions increasing

Chlorine, $\mathrm{Cl}_{2}$
Particles far apart; possess complete freedom of motion

Bromine, $\mathrm{Br}_{2}$
Particles are closely packed but randomly oriented; retain freedom of motion; rapidly change neighbors

- Atoms/molecules stick to each other in liquid/ solid, always stick more in solid.
- Atoms/molecules don't touch in gas.
- Liquid to gas, E is needed to pull the atoms/molecules from each other.

## Heating Curves

Heat added

- A plot of T vs. q
- Within a phase:
- $q=m s$
- The temperature of the substance does not rise during a phase change.
- For the phase changes, the product of mass and the heat of fusion of vaporization is heat.

## Heating Curves

Heat added

- A plot of T vs. q
- Within a phase:
- $q=m s$
- The temperature of the substance does not rise during a phase change.
- For the phase changes, the product of mass and the heat of fusion of vaporization is heat.

## Heating Curves

Heat added

- A plot of T vs. q
- Within a phase:
- $q=m s \Delta T$
- During melting:
- $\mathrm{q}=\Delta \mathrm{H}_{\text {fus }} \mathrm{m}$
- During boiling:
- $\mathrm{q}=\Delta \mathrm{H}_{\text {vap }} \mathrm{m}$
- For the phase changes, the product of mass and the heat of fusion of vaporization is heat.

## Example:

- Calculate q for taking 10 g ice from A to F:
- For the phase changes, the product of mass and the heat of fusion of vaporization is heat.

## Example:

$\Delta \mathrm{H}_{\text {Fus }}$ water: $334 \mathrm{~J} / \mathrm{g}$ $\Delta h_{\text {vap }}$ water: $2444 \mathrm{~J} / \mathrm{g}$ s water: $4.184 \mathrm{~J} / \mathrm{g}^{\circ} \mathrm{K}$ s ice: $2.05 \mathrm{~J} / \mathrm{gK}$ s vapor: $2.00 \mathrm{~J} / \mathrm{gK}$

## Example:

$\Delta H_{\text {Fus }}$ water: $334 \mathrm{~J} / \mathrm{g}$ $\Delta h_{\text {vap }}$ water: $2444 \mathrm{~J} / \mathrm{g}$ s water: $4.184 \mathrm{~J} / \mathrm{g}^{\circ} \mathrm{K}$ s ice: $2.05 \mathrm{~J} / \mathrm{gK}$ s vapor: $2.00 \mathrm{~J} / \mathrm{gK}$

- Calculate $q$ for taking 10 g ice from A to F :
- $\mathrm{A}->\mathrm{B}:(10 \mathrm{~g}) 2.05 \mathrm{~J} / \mathrm{gK}\left(25^{\circ} \mathrm{C}\right)=512.5 \mathrm{~J}$
- B-> C: $10 \mathrm{~g}(334 \mathrm{~J} / \mathrm{g})=3340 \mathrm{~J}$
- C -> D: $10 \mathrm{~g}(4.184 \mathrm{~J} / \mathrm{gK})(100 \mathrm{~K})=4184 \mathrm{~J}$
- D -> E: $10 \mathrm{~g}(2444 \mathrm{~J} / \mathrm{g})=24440 \mathrm{~J}$
- E -> F: $10 \mathrm{~g}(2.00 \mathrm{~J} / \mathrm{gK})(25 \mathrm{~K})=500 \mathrm{~J}$
- TOTAL
$=32977 \mathrm{~J}$

## Energy in Foods

## Most of the fuel in the food we eat comes from carbohydrates and fats.

|  | Approximate Composition (\% by mass) |  |  | Fuel Value |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Carbohydrate | Fat | Protein | kJ/g | kcal/g (Cal/g) |
| Carbohydrate | 100 | - | - | 17 | 4 |
| Fat | - | 100 | - | 38 | 9 |
| Protein | - | - | 100 | 17 | 4 |
| Apples | 13 | 0.5 | 0.4 | 2.5 | 0.59 |
| Beer ${ }^{*}$ | 1.2 | - | 0.3 | 1.8 | 0.42 |
| Bread | 52 | 3 | 9 | 12 | 2.8 |
| Cheese | 4 | 37 | 28 | 20 | 4.7 |
| Eggs | 0.7 | 10 | 13 | 6.0 | 1.4 |
| Fudge | 81 | 11 | 2 | 18 | 4.4 |
| Green beans | 7.0 | - | 1.9 | 1.5 | 0.38 |
| Hamburger | - | 30 | 22 | 15 | 3.6 |
| Milk (whole) | 5.0 | 4.0 | 3.3 | 3.0 | 0.74 |
| Peanuts | 22 | 39 | 26 | 23 | 5.5 |

*Beers typically contain $3.5 \%$ ethanol, which has fuel value.
Copyright © 2006 Pearson Prentice Hall, Inc.

## What' s the deal with fat?

- Carbohydrates:
- $\mathrm{C}_{\mathrm{n}} \mathrm{H}_{2 \mathrm{n}} \mathrm{O}_{\mathrm{n}}+\mathrm{nO}_{2}-->$--> --> $\mathrm{nCO}_{2}+\mathrm{nH}_{2} \mathrm{O}+$ Energy
- Fats:
more steps
- $\mathrm{C}_{n} \mathrm{H}_{2 n} \mathrm{O}_{2}+\mathrm{mO}_{2}-->-->-->-->-->-->\mathrm{nCO}_{2}+\mathrm{nH}_{2} \mathrm{O}$

Fat storage.

It also clogs your arteries.

## Energy and oxidation states

- Oxidation state of C - Oxidation state of C in a fatty acid: in glucose:
- $\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{O}_{6}$

## Energy and oxidation states

- Oxidation state of $C$ - Oxidation state of C in in a fatty acid: glucose:

- $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$

- 0
$-3-2-2-2-2-2-2-2+3$
- Both go to $\mathrm{CO}_{2} \mathrm{C}:+4$

## Fuels

## The vast majority of the energy consumed in this country comes from fossil fuels.

## U.S. Energy Consumption by Energy Source, 2009

Total = 94.578 Quadrillion Btu
Total $=7.744$ Quadrillion Btu

Note: Sum of components may not equal $100 \%$ due to independent rounding.
Source: U.S. Energy Information Administration, Annual Energy Review 2009, Table 1.3, Primary Energy Consumption by Energy Source, 1949-2009 (August 2010).

## Major issues

- Portable fuel (liquid, relatively light), transportation
- Non-portable fuel (makes electricity).
U.S. Energy Consumption by Energy Source, 2009

Total $=94.578$ Quadrillion Btu Total $=7.744$ Quadrillion Btu

Note: Sum of components may not equal $100 \%$ due to independent rounding.
Source: U.S. Energy Information Administration, Annual Energy Review 2009, Table 1.3, Primary Energy Consumption by Energy Source, 1949-2009 (August 2010).

## The Energy cycle:

- Us (and almost everything else alive on the earth):
- $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}+6 \mathrm{O}_{2}--->6 \mathrm{CO}_{2}+6 \mathrm{H}_{2} \mathrm{O}$
- Fossil fuel production:
- $\mathrm{CH}_{4}+2 \mathrm{O}_{2}--->\mathrm{CO}_{2}+2 \mathrm{H}_{2} \mathrm{O}$ (for methane)
- Plants:
- $6 \mathrm{CO}_{2}+6 \mathrm{H}_{2} \mathrm{O}+$ light $---->\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}+6 \mathrm{O}_{2}$

Net $\mathrm{CO}_{2}$ production could therefore be 0 .

Energy research on campus ADREC
Anaerobic digestor

## Energy research on campus

 ADREC Anaerobic dígestor- Anaerobic Digestion:
bacteria
- $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}--->3 \mathrm{CO}_{2}+3 \mathrm{CH}_{4}$

Basically:

$$
\text { Poop }---\rightarrow \mathrm{CO}_{2}+\mathrm{CH}_{4}
$$

https://www.egr.msu.edu/bae/adrec/feature/south-campus-anaerobic-digester

## Hydrogen, the perfect fuel?

$2 \mathrm{H}_{2}+\mathrm{O}_{2}---->2 \mathrm{H}_{2} \mathrm{O} \quad \Delta \mathrm{H}=-285 \mathrm{~kJ} / \mathrm{mol} \mathrm{H}_{2}(1 \mathrm{~mol} / 2 \mathrm{~g})=-142 \mathrm{~kJ} / \mathrm{g}$

This is literally what fuel cells do. You get nothing but water!

## The problem with oil

- Not "renewable" (will run out)
- Pollution (combustion not perfect).
- Global warming
$\mathrm{CO}_{2}$ absorbs heat.
$\mathrm{C}_{\mathrm{n}} \mathrm{H}_{2 \mathrm{n}+2}+(3 \mathrm{n}+1 / 2) \mathrm{O}_{2}-\cdots-->\mathrm{nCO}_{2}+(\mathrm{n}+1) \mathrm{H}_{2} \mathrm{O}$

## Efficiency/conservation

- U.S. could decrease energy needs by 20-50\% by being less wasteful.
- High mileage cars
- more energy efficient building/homes.

## Hybrid car

- Gas engine plus electric motor
- Why?
- All the energy is still coming from burning gasoline.

## Hybrids

- Electric motors are way more efficient than gas engines. (94\%)
- Note, your engine is very hot,
- It must be cooled
- Flush all that E down drain. No work, only heat.

Typical Energy Split in Gasoline Internal Combustion Engines

gas engines are 24-30\% efficient
Problem: batteries suck!
Heavy, expensive, limited recharging cycles, limited current etc.

## Li ion battery

$$
\begin{aligned}
& x^{-}+x \mathrm{Li}^{+}+\mathrm{Li}_{1-\mathrm{x}} \mathrm{Co}(\mathrm{IV}) \mathrm{O}_{2}-----> \mathrm{LiCo}(\mathrm{III}) \mathrm{O}_{2} \\
& \mathrm{Li}_{\mathrm{x}} \mathrm{C}_{6}-\ldots--->\mathrm{xLi}^{+}+\mathrm{xe}^{-}+\mathrm{C}_{6}
\end{aligned}
$$

Lithium is really light.
Dissolves in organic solvents which are also light.
Li is at the top of the activity series. Means a higher potential (more voltage per battery cell)

## Hybrids

- Electric motors work at low speeds
- gas engine shuts off when not needed
- at low speeds, stop lights, etc.
- (infinite torque, really go from 0-15)
- Gas engine charges battery and is used at higher speeds
- Hybrids get BETTER gas milage in town versus highway

## Other sources

## How much bang for your buck?

Approximate Elemental
Composition (mass \%)

|  | C | H | O | Fuel Value (kJ/g) |
| :--- | ---: | ---: | ---: | :--- |
| Wood (pine) | 50 | 6 | 44 | 18 |
| Anthracite coal (Pennsylvania) | 82 | 1 | 2 | 31 |
| Bituminous coal (Pennsylvania) | 77 | 5 | 7 | 32 |
| Charcoal | 100 | 0 | 0 | 34 |
| Crude oil (Texas) | 85 | 12 | 0 | 45 |
| Gasoline | 85 | 15 | 0 | 48 |
| Natural gas | 70 | 23 | 0 | 49 |
| Hydrogen | 0 | 100 | 0 | 142 |

## The problem with Hydrogen

## Storage

gas, less dense, hard to get enough in the car and have trunk space

Kaboom (Hindenburg)

Where do you get the hydrogen?

## The problem with Hydrogen

Where do you get the hydrogen? (petroleum)
$\mathrm{CH}_{4}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{g}) \rightarrow--\mathrm{CO}(\mathrm{g})+\mathrm{H}_{2}(\mathrm{~g})$
$\mathrm{CO}(\mathrm{g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{g})-\mathrm{CO}_{2}(\mathrm{~g})+\mathrm{H}_{2}(\mathrm{~g})$

## Ethanol, where does it come from

- Alcoholic fermentation:
- $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}--->2 \mathrm{CO}_{2}+2 \mathrm{C}_{2} \mathrm{H}_{5} \mathrm{OH}$ (ethanol) $\Delta \mathrm{H}=-76 \mathrm{~kJ} / \mathrm{mol}$
- -1270 2(-393) 2(-280)
- (anaerobic, bacteria \& yeast can do this, we can' t)

Exactly the same place it comes from in your beer.

## Ethanol

- Alcoholic fermentation:
- $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$ bug $2 \mathrm{CO}_{2}+2 \mathrm{C}_{2} \mathrm{H}_{6} \mathrm{O}$ (ethanol) $\Delta \mathrm{H}=-76 \mathrm{~kJ} / \mathrm{mol}$
- $12702(-393) 2(-280)$
- (anaerobic, yeast can do this, we can' t) only to $10 \%$.
- Distillation (requires energy) to purify.

## Alcohol combustion:

$\mathrm{C}_{2} \mathrm{H}_{6} \mathrm{O}+\mathrm{O}_{2}--->2 \mathrm{CO}_{2}+3 \mathrm{H}_{2} \mathrm{O} \quad \Delta \mathrm{H}=-1367 \mathrm{~kJ} / \mathrm{mol}(1 \mathrm{~mol} / 46 \mathrm{~g})=-29.7 \mathrm{~kJ} / \mathrm{g}$
But why would this be better for global warming?

## Ethanol, problems

- Lots of land to grow (yield 2-4 tons/acre)
- All present agricultural land in U.S. would not be enough for all transportation needs.
- requires fertilizer, tractors,etc. for growing (energy)
- Distillation requires energy
- For every 1.4 kJ need 1.0 kJ, much more than oil
- Brazil, however, is approaching 50\% ethanol for transportation
- Why? Sugar cane, largest starch or sugar yield/acre.
- But, you can' t grow sugar cane on the great plains.

## Ethanol

 Two major types of carbohydrates in plants- However, presently we only use Starch,

not cellulose
Most stuff in plants is cellulose

## Cellulosic ethanol

- 10+ tons/acre (as opposed to 2-4 tons/acre)
- Can use any crop, not just food crops with high starch ("switch grass").
- Problem: Breaking it down to small sugars that yeast can ferment.
- Need cellulase, the enzyme that breaks this up.
- This is a comparatively easy problem to solve
- (compared to hydrogen.)

Ethanol can work.

## Things to consider

- Energy yield (how much E out versus E in)?
- Break even price (how much/gallon of gas equivalents (present corn ethanol is 2.25 /gallon just to make).
- Where is the technology NOW?
- Is storage required, \& if so, how you gonna do it
- (solar when the sun doesn' t shine)
- Remember, at present Batteries suck!

## The Chemistry Nobel Prize

- Daniel Shechtman,
- Technion, Israel
- For:
- The discovery of "quasi-crystals" in 1984

## The Chemistry Nobel Prize

- An Ho-Mg-Zn quasi-crystal

Note, the five-fold symmetry of the faces!
This was thought to be impossible! Is this a solid?

## The Thermite reaction

- $2 \mathrm{Al}+\mathrm{Fe}_{2} \mathrm{O}_{3}-$------> $\mathrm{Al}_{2} \mathrm{O}_{3}+2 \mathrm{Fe}$
- What kind of reaction is this?
- Why does it happen?
- Used for welding railroad tracks
- What is the heat of reaction given:
- $2 \mathrm{Fe}+3 / 2 \mathrm{O}_{2}$-----> $\mathrm{Fe}_{2} \mathrm{O}_{3} \quad \Delta \mathrm{H}=-825.5 \mathrm{KJ}$
- $2 \mathrm{Al}+3 / 2 \mathrm{O}_{2}$-----> $\mathrm{Al}_{2} \mathrm{O}_{3} \quad \Delta \mathrm{H}=-1675.7 \mathrm{KJ}$

## The Thermite Reaction

- $2 \mathrm{Al}+\mathrm{Fe}_{2} \mathrm{O}_{3}------>\mathrm{Al}_{2} \mathrm{O}_{3}+2 \mathrm{Fe}$
- What is the heat of reaction given:
- $2 \mathrm{Fe}+3 / 2 \mathrm{O}_{2}$-----> $\mathrm{Fe}_{2} \mathrm{O}_{3}$

$$
\Delta \mathrm{H}=-825.5 \mathrm{KJ}
$$

- $2 \mathrm{Al}+3 / 2 \mathrm{O}_{2}$-----> $\mathrm{Al}_{2} \mathrm{O}_{3}$ $\Delta \mathrm{H}=-1675.7 \mathrm{KJ}$
- $2 \mathrm{Al}+3 / 2 \mathrm{O}_{2}$-----> $\mathrm{Al}_{2} \mathrm{O}_{3}$

$$
\begin{gathered}
\Delta \mathrm{H}=-1675.7 \mathrm{KJ} \\
\Delta \mathrm{H}=825.5 \mathrm{KJ}
\end{gathered}
$$

- $\mathrm{Fe}_{2} \mathrm{O}_{3}$-----> $2 \mathrm{Fe}+3 / 2 \mathrm{O}_{2}$
- $2 \mathrm{Al}+\mathrm{Fe}_{2} \mathrm{O}_{3}------>\mathrm{Al}_{2} \mathrm{O}_{3}+2 \mathrm{Fe} \Delta \mathrm{H}=-850.2 \mathrm{KJ}$

A thermite mystery:
http://www.youtube.com/watch?v=BnHR4cMXiyM
